

How does Facial Cupping work?

The cup is lightly pressed on one part of the face, creating a gentle suction. This draws the blood flow to the surface. The resulting increased blood flow to the skin and surrounding tissue stimulates the formation of new skin cells. The suction also creates a controlled mini-trauma in the skin, similar to micro-needling, which stimulates a natural healing process in the skin. More oxygenated blood flows to the treated area, collagen and fibroblast production is stimulated, and skin cells are effectively stimulated to multiply and renew.

Effect

The result is skin that feels and looks plumper, healthier and more radiant. Tension in the face is released, physical imbalance is improved and even stuck emotions are soothed. This intensive yet gentle treatment method is also excellent for treating scars, blemishes, headaches, and saggy skin.

regularity is very important to achieve the best results.
